1 First

This is a simple example of using the `ledmac` package with ordinary LaTeX constructs.

1.1 Example text

1 The `ledmac` package lets you do some unusual things in a LaTeX document. For
2 example you can have lines numbered and there are several levels of footnotes. You
3 can label lines within the numbered text and refer to them outside. Do not try and use
4 any normal LaTeX footnoting or *exotica* within the numbered portions of the text.

2 Last

I forgot to mention that you can use ordinary footnotes^{1,2} outside the numbered text.
You can also^a have^b formatted footnotes^c in normal^d text.

There are 4 numbered lines in the example shown in section 1.1.

*Standing on the shoulders of giants.

¹An ordinary footnote

²And another

^aAdditionally ^bSpecify ^cLike this ^dText that does not have line numbers

2 several] This is an 'A' footnote.

4 *exotica*] Like floats.

2 levels] This is a 'B' level footnote.
